

Ottemeier

Perfection, when it matters most.

## Strong innovations:

Customised machine engineering  
and tool manufacturing.

The success of an idea depends largely on perfect implementation. This is where we are first choice as your competent partner. Whatever ideas our customers may have – we know and have what it takes to develop, construct and implement the optimal solution. The focus lies in modern automated roll forming profile processing, especially in the areas of punching and handling – ranging all the way from the raw material to the finished part.

Ensuring your ideas work: experience and creativity.

We offer complete solutions from a single partner as well as individual system components for production facilities. Our customers benefit from the same experience and competence in tool making. The large number of well-known companies with which we have worked together for many years proves our excellent performance standards.

Ottemeier

Perfection, when it matters most.

Our solutions are  
as unique as your  
projects.

Both, in special machines as well as in tool design and construction, our employees show competence, experience and creativity. State-of-the-art machinery, skills, and the passion for perfect results provide powerful, customised solutions.

Our specialised solutions in the field of sheet-metal processing for modern production facilities, focussing on the

furniture, construction and automotive industries, constantly serve to set and develop new standards.

Of course, all our procedures and sections are certified to current international quality standards (ISO 9001) and are incorporated in a high-performance environmental management system (ISO 14001).

## Customised machine engineering

The development and implementation of customised machine engineering requires specialised skills. This is where, next to technical know-how, the need to be able to view challenges from new and creative perspectives is indispensable. With a pragmatic creativity and flexibility, our staff are always able to achieve new and innovative concepts at the highest technical level.

One of our core competencies is the automated processing of roll forming profiles and any other type of sheet metal. Our portfolio also includes:

- Punching tables for hydraulic driven tools
- Special presses
- Stacking units
- Drilling and milling machines
- Welding machines
- Robotic cells
- Handling systems

With our excellent experience and industrial know-how we are able to respond exceptionally quickly and to understand precisely the specific requirements and production processes our customers need. In this way, complete individual automation concepts as well as tools for the processing of products and components are created.

If required, we can provide close and competent support and dialog right from the beginning of your product development, finding the optimum manufacturing engineering solution. Each project is handled completely professionally and reliably by our own research and development teams. We would be more than pleased to take any special delivery requirements our customers may have into consideration. We work exclusively with reputable partners and suppliers that provide us with high quality products and services.

Our modern machinery facility is in itself, designed and constructed for extreme requirements. Whether it is exceptional precision that is required or unusual dimensions, whether the processing of special materials or particularly complex parts – high quality is guaranteed in every phase of the project.

### Just perfect, as is our service.

Our service goes far beyond the finished machine. After the preliminary acceptance in our plant by our own specially trained staff, the machine is commissioned at our customer's site with great care and diligence.

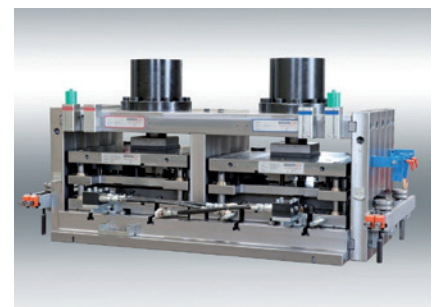

In addition, we are naturally available for the qualified training of maintenance and operating staff, along with a comprehensive after-sales service.

## Tool manufacture

Having our own tool manufacturing facilities is an essential part of our service range. The expertise and experience from this segment is also available as an independent service to our customers. We manufacture flexible tools for a wide range of industries – here also, innovative special solutions for special applications are a key aspect:

- Pre-punching-, post-punching- and cutting tools for roll forming profile processing
- Punching tools
- Bending tools
- Embossing tools
- Clinching tools

Here all common drive concepts are available from mechanical to pneumatic and from hydraulic to servo-hydraulic rapid punch drives.
